Milestone 4 Documentation

Testing, Deployment & Documentation

PricePilot AI: Dynamic Pricing Optimization & Revenue Intelligence System

Objective

The objective of PricePilot AI is to develop an AI-powered dynamic pricing and revenue intelligence system that helps businesses optimize product prices based on market demand, competitor pricing, customer behavior, sales performance, inventory, and market conditions.

The platform supports price prediction, demand forecasting, competitor analysis, revenue optimization, profitability analysis, pricing recommendations, and business intelligence through a centralized platform.

For Milestone 4, the focus is on **Testing, Deployment & Documentation**. The milestone validates the developed system, improves model and platform performance, deploys the complete application, prepares the final documentation and presentation, and demonstrates the complete PricePilot AI platform.

Milestone 4 Scope

Milestone 4 focuses on the final testing, optimization, deployment, documentation, and demonstration of the PricePilot AI platform.

The major scope of this milestone includes:

- Validate prediction accuracy and recommendation quality.
 - Optimize pricing algorithms and dashboard responsiveness.
 - Deploy the platform using Docker and cloud environments.
 - Prepare final project documentation and presentation.
 - Demonstrate the complete PricePilot AI platform.
-

Data Source

Datasets Used

Five datasets were reviewed and collected for PricePilot AI. They cover complementary aspects of pricing, products, customer reviews, retail demand, competitor pricing, promotions, inventory, profitability, and economic conditions.

Dataset	Rows	Columns	Primary Purpose
Amazon Product Pricing & Reviews	1,465	16	Product price, discount, rating and review information
Amazon Product Pricing	20	11	Product pricing, discount, rating and stock information
Retail Price Optimization	1,040	13	Weekly price, competitor price and sales-volume analysis
Favorita Store Sales	7,300	8	Store/product demand, promotions, holidays and economic indicator
Integrated Pricing & Demand	7,300	31	Consolidated pricing, demand, competition, inventory and profitability dataset

Dataset Integration Rationale

The five datasets were not treated as interchangeable records. Each contributes a different business perspective. The Amazon datasets provide product-level pricing, discount, rating, review, and stock context. The Retail Price Optimization dataset provides competitor-price and weekly-sales relationships. The Favorita dataset provides store-level demand, promotions, holidays, and an economic indicator. The Integrated Pricing & Demand dataset combines the main pricing, demand, competition, inventory, and profitability variables into one structured dataset.

The integrated dataset provides the main structured foundation for the PricePilot AI system, while the other datasets support validation, exploratory comparison, and feature understanding.

Tasks Completed in Milestone 41. Validate Prediction Accuracy and Recommendation Quality

The developed pricing prediction and demand forecasting models are evaluated using appropriate performance measures. The validation process checks prediction accuracy and recommendation quality to ensure that the system produces reliable pricing and demand insights.

2. Optimize Pricing Algorithms and Dashboard Responsiveness

The pricing algorithms and dashboard workflows are reviewed and optimized to improve system performance and usability. The optimization focuses on efficient pricing analysis, faster responses, and smooth dashboard interaction for business users.

3. Deploy Platform Using Vercel

The PricePilot AI platform is deployed on **Vercel** to make the developed application accessible as a live web platform. The deployment provides a production-ready environment for the frontend and allows users to access and demonstrate the complete PricePilot AI system through the deployed application.

4. Prepare Final Project Documentation and Presentation

The final project documentation and presentation are prepared to describe the complete PricePilot AI system, including its objectives, architecture, datasets, machine learning workflows, pricing intelligence, revenue optimization, testing, and deployment.

5. Demonstrate the Complete PricePilot AI Platform

The complete PricePilot AI platform is demonstrated as an end-to-end system. The demonstration brings together the developed pricing, forecasting, competitor analysis, revenue optimization, analytics, and business intelligence workflows to show the complete functionality of the project.

Screenshot Of Implementention of Mildstone 4

1. Implement Competitor Monitoring Workflows

Competitor monitoring workflows are developed to examine competitor pricing information and understand the competitive pricing environment. The workflow uses pricing and market-related data to support comparison between the product price and competitor prices. This provides the foundation for identifying competitive positioning and pricing opportunities.

Screenshot:

2. Generate Pricing Comparison Reports

Pricing comparison reports are generated to provide a structured view of product prices in relation to competitor prices. These reports help identify differences in pricing and provide information that can be used for pricing analysis and decision-making.

Screenshot:

3. Landing Page

The landing page provides the initial interface of the PricePilot AI platform and introduces the system's dynamic pricing and revenue intelligence capabilities. It presents the platform's main purpose and provides users with access to the application.

Screenshot:

4. Sign Up Page/create account

The sign-up page allows new users to create an account and access the PricePilot AI platform. It collects the required user information and supports the initial user registration process before authentication and access to the system.

5. Login Page

The login page provides the entry point for users to securely access the PricePilot AI platform. It supports user authentication and controlled access to the system based on the implemented user-management and access-control functionality.

6. Develop Profitability Analytics Dashboards

Profitability analytics dashboards are developed to present important profitability and pricing-related information in an accessible visual format. The dashboards support monitoring of revenue, profitability, pricing performance, and product-level business performance.

Screenshot:

7. Generate Pricing Strategy Recommendations

Pricing strategy recommendations are generated using the available pricing, demand, competitor, and profitability information. The recommendations are intended to support pricing decisions by identifying suitable pricing opportunities and strategies based on the analyzed business information.

The screenshot shows the PricePilot AI Price Prediction Engine interface. It features a sidebar with navigation options similar to the dashboard. The main content area is titled 'Powered by LightGBM Regressor (Test R² = 1.0000, RMSE = \$0.45) across 18 market features'. It contains several input fields for product information: 'SELECT PRODUCT TEMPLATE' (with a dropdown menu), 'CATEGORY' (set to Electronics), 'MANUFACTURING / COST PRICE (\$)' (110.50), 'BASE MSRP (\$)' (220.00), 'COMPETITOR 1 PRICE (\$)' (199.90), 'COMPETITOR 2 PRICE (\$)' (195.00), 'COMPETITOR 3 PRICE (\$)' (194.40), 'SALES CHANNEL' (set to Direct Web), 'DISCOUNT PERCENTAGE (%)' (0%), and 'PRODUCT RATING (1.0 - 5.0)' (4.6 stars). A large blue button at the bottom is labeled 'Price Optimization'.

8. Build Executive Business Intelligence Reports

Executive business intelligence reports provide summarized business information for higher-level analysis and decision-making. The reports bring together relevant pricing, revenue, profitability, market, and performance information into a structured business intelligence view.

Milestone 4 Outcomes

The expected outcomes of Milestone 4, as defined in the PricePilot AI project document, are:

- Gain deployment and testing experience.
- Improve prediction accuracy and platform usability.
- Complete live deployment and final demonstration.
- Prepare professional project documentation and presentation.

How Objectives Are Achieved

The objectives of Milestone 4 are achieved by performing final validation and optimization of the complete PricePilot AI platform.

First, the prediction models and pricing recommendations are tested using relevant AI model performance metrics such as price prediction accuracy, demand forecasting accuracy, MAE, and RMSE. Business performance can also be evaluated through revenue improvement, pricing recommendation effectiveness, and demand prediction reliability.

The system is then optimized to improve pricing algorithm performance, prediction response time, dashboard loading speed, and overall platform usability.

The **PricePilot AI platform is deployed on Vercel**, providing a live web-accessible environment for the developed application. The deployment enables the complete platform to be accessed and demonstrated through the live application.

Finally, all developed modules are brought together for the complete platform demonstration. The final documentation and presentation provide a consolidated explanation of the project and its implementation.

Conclusion

Milestone 4 completes the final stage of the PricePilot AI project by focusing on **testing, deployment, optimization, documentation, and demonstration**.

The milestone validates the developed prediction and recommendation workflows, improves pricing algorithms and dashboard responsiveness, deploys the application on Vercel, and brings together the complete PricePilot AI platform for an end-to-end demonstration.

The final stage also provides deployment and testing experience, improves prediction accuracy and platform usability, completes the live deployment and final demonstration, and produces the professional documentation and presentation required for the project.
